

Temp-Wrap™ Installation Instructions

The Temp-Wrap™ system consists of three parts:

- 1. A starter which is 6' long with a miter on one end.**
- 2. A center piece which is 6 ' long and square on both ends.**
- 3. A finish or end piece which is a short piece with a miter on one end.**

To install:

Look at the side of the barrel or pipe, take the starter piece and lay the mitered edge at front edge of barrel (barrel left as you are facing it) and begin wrapping by Velcro-ing strip to itself as you wrap. Next add to end of starter piece however many middle or straight pieces as needed to cover length of barrel. Short ending piece then goes on last.

Sizing to length:

It will be necessary to size length of last section before end piece to make length come out correctly. Simply cut to length, lap fabric over to contain insulation. Fasten this cut end to short finish (end) piece using button fasteners provided.
